

AI & Vibe Coding Tour

Chapter 6 — Polish + Deployment

SESSION 1: POLISH FIRST

Make it real. Ship it.

#Deploy

#Polish

#Ship

· vibecode.tours

SESSION 1

Polish First

The paradigm shift

Claude does the work.

You direct and validate.

Today — Session 1

- Polish philosophy
- UX polish workshop
- README generation
- Analytics setup
- Demo script prep

Polish First

Polish first, deploy second

A rough deploy looks worse than an undeployed polished project.

First impressions stick.

[DEMO]

Claude reviews your project

"List the top 5 UX improvements."

UX Polish

Four polish essentials

1. Loading states
2. Error handling
3. Empty states
4. Mobile responsive

Claude implements. You validate.

```
Add loading states to all async operations.  
Show a spinner while data loads.
```

Review every diff. Reject what's wrong.

[WORKSHOP]

Claude-driven UX polish

20 minutes — teams + Claude.

frontend-design skill

```
/skill frontend-design  
Fix spacing, hover states, typography.
```

Claude polishes the visual layer.

Chrome DevTools MCP

Claude inspects the live page.

Finds layout issues. Fixes CSS directly.

README

Your project's front door

The README is the first thing anyone reads.

Demo Day judges included.

Good vs bad

Bad: "My project. Made with React."

Good: Title, screenshot, features, setup, team.

[WORKSHOP]

Claude drafts README

```
Read this codebase. Draft a comprehensive  
README with actual commands and features.
```

Verify the README

Test the getting-started commands yourself.

Claude sometimes lists features that don't exist.

Analytics

How do you know if anyone visits?

Analytics. Quick setup — not a deep dive.

Vercel Analytics, Plausible, or a simple counter.

[WORKSHOP]

Claude adds analytics

10 minutes. Verify it doesn't break the build.

Demo Prep

The 5-minute demo format

1. **Hook** — 30s
2. **Solution** — 1 min
3. **Live demo** — 3 min
4. **Tech** — 30s
5. **What I learned** — 30s

Structure from Claude. Authenticity from you.

```
Write a 5-min demo script for our project.
```

"What I learned" — you write that part.

[WORKSHOP]

Demo script generation

15 minutes. Generate, review, read aloud once.

Session 1 — done

Homework:

- Create Vercel / Netlify / Railway account
- `npm run build` must pass
- Push all polish changes

Next: **Deployment day.**

SESSION 2

Deployment + AI-augmented Security

Today — Session 2

- Choose deploy platform
- Claude-driven deploy
- AI security audit
- Custom domain
- Live URL share

Deploy Options

The landscape

Platform	Best for
Vercel	Next.js, React, static
Netlify	Static, JAMstack
Railway	Backend + database

Ask Claude which fits

```
Our stack is [X]. Compare Vercel,  
Netlify, Railway. Which fits best?
```

Decide fast. Don't agonize.

Deploy

Pre-deploy checklist

```
npm run build      OK Build passes
cat .gitignore     OK .env listed
cat .env.example   OK Template exists
git status         OK All committed
```

[WORKSHOP]

Claude deploys your project

40 minutes. Claude handles. You validate each step.

Support hierarchy

Claude → Team → Channel → Instructor

That order. Always.

The #1 deploy killer

Environment variables not set on the platform.

Check. Then check again.

Live URL

Your project is on the internet.

Anyone in the world can visit it now.

Security

.env is sacred

`.env` holds secrets. **Never commit it.**

`.env.example` is the template. Commit that.

```
git rm --cached .env
```

3 approaches, same goal

Skills: `/skill security-audit` — fast, structured

MCP: automated scanner — catches secrets

Agent: file-by-file review — thorough, slow

[DEMO]

AI security audit — 3 approaches

Same project. Three methods compared.

Prompt injection

User input sent to AI = danger.

The AI-age version of "never trust user input."

GitHub Actions bonus

```
on: push  
  run: npm audit --audit-level=high
```

Automated security on every push. Awareness only.

Custom Domain

Domain + DNS basics

A record → IP address

CNAME → another domain

Propagation: up to 24 hours. Patience.

[WORKSHOP]

Claude configures your domain

Optional. Platform subdomain is perfectly fine.

Share

Post your URL

Right now. In the channel.

Visit each other's projects.

Update your README

```
## Live Demo  
[Visit the app](https://yourproject.vercel.app)
```

Chapter 6 — done

Your project went from laptop to live URL.

Polished. Deployed. Security audited. Demo-ready.

Homework

- Live URL posted in channel
- README with URL + screenshots
- Env vars properly handled
- 1 security finding addressed

Next: Chapter 7

The AI landscape beyond Claude.

Different tools. Different approaches. MCP ecosystem.
